

SOFT TRAFFIC BRIDGE of SIESNIKI – ESTONIA

The **Siesniki Bridge** is a 30 m long bridge for soft traffic connecting Estonia and Russia over the Piusa River.

By 2015, the small bridge was in a very critical condition. It was cleaned by sand-blasting and high-pressure cleaning before being coated with **ZINGA** (120 µm DFT) in end of September, beginning of October.

By the time of application, it was very muggy weather – conditions in which normal paint systems could not be applied. This is one of the reasons that the **State Real Estate** choose **ZINGA** for protection of the steel bridge. They were very pleased with the outcome.

System:

ZINGA

120 µm DFT
